Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Description

TBA

Project Engagement

During the 9th of July 2022, Metacces Team engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
Medium	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
 - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
 - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
 - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
 - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
 - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

```
> SafeMath
> Context
> IERC20
> IERC20Metadata
> ERC20
```

```
> IERC20
> SafeMath
```

Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

v1.0

File Name	SHA-1 Hash
contracts/BSCBridge.sol	a3e1234de1aefa99dcc643b4b69dcc6ed9e481ca
contracts/Metacces.sol	c8d44b2485ad6d826ec255d1d0a9f1e8febe38b2

v1.0

Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Is contract an upgradeable
2. Correct implementation of Token standard
3. Deployer cannot mint any new tokens
4. Deployer cannot burn or lock user funds
5. Deployer cannot pause the contract
6. Overall checkup (Smart Contract Security)

Is contract an upgradeable

Name	
Is contract an upgradeable?	No

Correct implementation of Token standard

ERC20				
Function	Description	Exist	Tested	Verified
totalSupply	Provides information about the total token supply			
balanceOf	Provides account balance of the owner's account			
transfer	Executes transfers of a specified number of tokens to a specified address			
transferFrom	Executes transfers of a specified number of tokens from a specified address			
approve	Allow a spender to withdraw a set number of tokens from a specified account			
allowance	Returns a set number of tokens from a spender to the owner			

Write functions of contracts v1.0

1. approve

2. changeMinMaxPrivateSale

3. decreaseAllowance

4. endSale

5. increaseAllowance

6. privateSale

7. setBridge

8. setPrivateLimit

9. startSale

10. transfer

11. transferFrom

12. transferOwnership

13. withdrawalBNB

14. withdrawalToken

1. lockTokens

2. setGateway

3. transferOwnership

4. unlockTokens

5. withdrawEthToOwner

6. withdrawTokenToOwner

Deployer cannot mint any new tokens

Name	Exist	Tested	Status
Deployer cannot mint			
Max / Total Supply	500.000.000		

Deployer cannot burn or lock user funds

Name	Exist	Tested	Status
Deployer cannot lock			
Deployer cannot burn			

Deployer cannot pause the contract

Name	Exist	Tested	Status
Deployer cannot pause			

Overall checkup (Smart Contract Security)

Tested	Verified

    Ⓜ onlyOwner

```

Comments:

- The state variable named “Bridge” serves no purpose in the contract.
- Client’s comments:
 - *The owners of the project wants to have their own bridge and they want their users to pay the gas fees from one side and they do it by the gateway from the other side.*
 - *If user A want to swap his tokens from BSC to polygon the following scenario occur:*
 - 1- *User will then click on swap*
 - 2- *Then the user send tokens to bsc bridge and the lock event is triggered*
 - 3- *on the other side we have a gateway wallet that will transfer the same amount sent to bsc bridge from polygon bridge to the user on the same address since all evm have same address, the gateway wallet pay for the gas fees to transfer the tokens to the user*
 - *The bridge cannot operate without the Moralis server, so if the Moralis server is down users can work with the tokens normally but they can’t swap it between chains*

Source Units in Scope

v1.0

Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

File	Logic Contracts	Interfaces	Lines	nLines	nSLOC	Comment Lines	Complex. Score
BSCBridge	2	1	295	240	103	155	71
Metacces	4	2	889	770	316	445	212
Totals	6	3	1184	1010	419	600	283

Audit Results

v1.1

AUDIT PASSED

Critical issues

No critical issues

High issues

No high issues

Medium issues

Issue	File	Type	Line	Description
#1	Metaccses	Withdraw tokens from the contract	859	<p>Owner can withdraw tokens to their address if they want instead of returning it to the users because there is no check to prevent this from happening.</p> <p>Please add a require check that will ensure that the owner can't withdraw the token to their account.</p> <p>Note: Users are advised to be careful while sending tokens because even after this issue is fixed, the owner can still send the tokens to another arbitrary account.</p>

Low issues

Issue	File	Type	Line	Description
#1	BSCBridge	A floating pragma is set	878	The current pragma Solidity directive is „^0.8.15"

Informational issues

Issue	File	Type	Line	Description
#1	Metacces	Bridge has no functionality	878	There is a function to set the bridge in the contract but there is no functionality or purpose in the contract itself.

Audit Comments

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <https://docs.soliditylang.org/en/v0.5.10/natspec-format.html>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

06. August, 2022:

- Users are advised to be careful while sending tokens because even after this issue is fixed, the owner can still send the tokens to another arbitrary account.
- Read the whole report and modifiers section for more information.
