## Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

## Description

Metaverser is a virtual world that enables users to have fun while playing inside its metaverse and earn income from different play-to-earn games.

The game mixes the world of finance and gaming, providing gamers with opportunities to generate an income while they play. Gamers will have more control by adding real-world value to their online entertainment.

They can participate in the game challenges, earn MTVTs and NFTs, and sell them at the marketplace and cryptocurrency exchanges. Assets are minted as non-fungible tokens (NFTs) and can be often traded on platforms outside the game's universe.

## Project Engagement

During the 30<sup>th</sup> of August 2022, **Metaverser** team engaged Solidproof.io to audit the smart contracts that they created. The engagement was technical in nature and focused on identifying the security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

# Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

## Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analyzing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

```
import './LandSalesData.sol'  
import './MarketplaceAssets.sol'
```

# Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

v1.0

File Name	SHA-1 Hash
contracts/LandSale2.sol	03aa5398686731589b8472db7e14ba5c7cdbc5f0

# Metrics

## Source Lines v1.0

## Risk Level v1.0

# Capabilities

## v1.0

## Components

 Contracts	 Libraries	 Interfaces	 Abstract
1	0	0	0

### Exposed Functions

This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.

 Public	 Payable
21	2

External	Internal	Private	Pure	View
0	7	0	0	13

### StateVariables

Total	 Public
16	6

### Capabilities

Solidity Versions observed	 Experimental Features	 Can Receive Funds	 Uses Assembly	 Has Destroyable Contracts
^0.8.12		yes		

 Transfers ETH	 Low-Level Calls	 DelegateCall	 Uses Hash Functions	 ECRecover	 New/Create/Create2
yes			yes		

 TryCatch	 Σ Unchecked

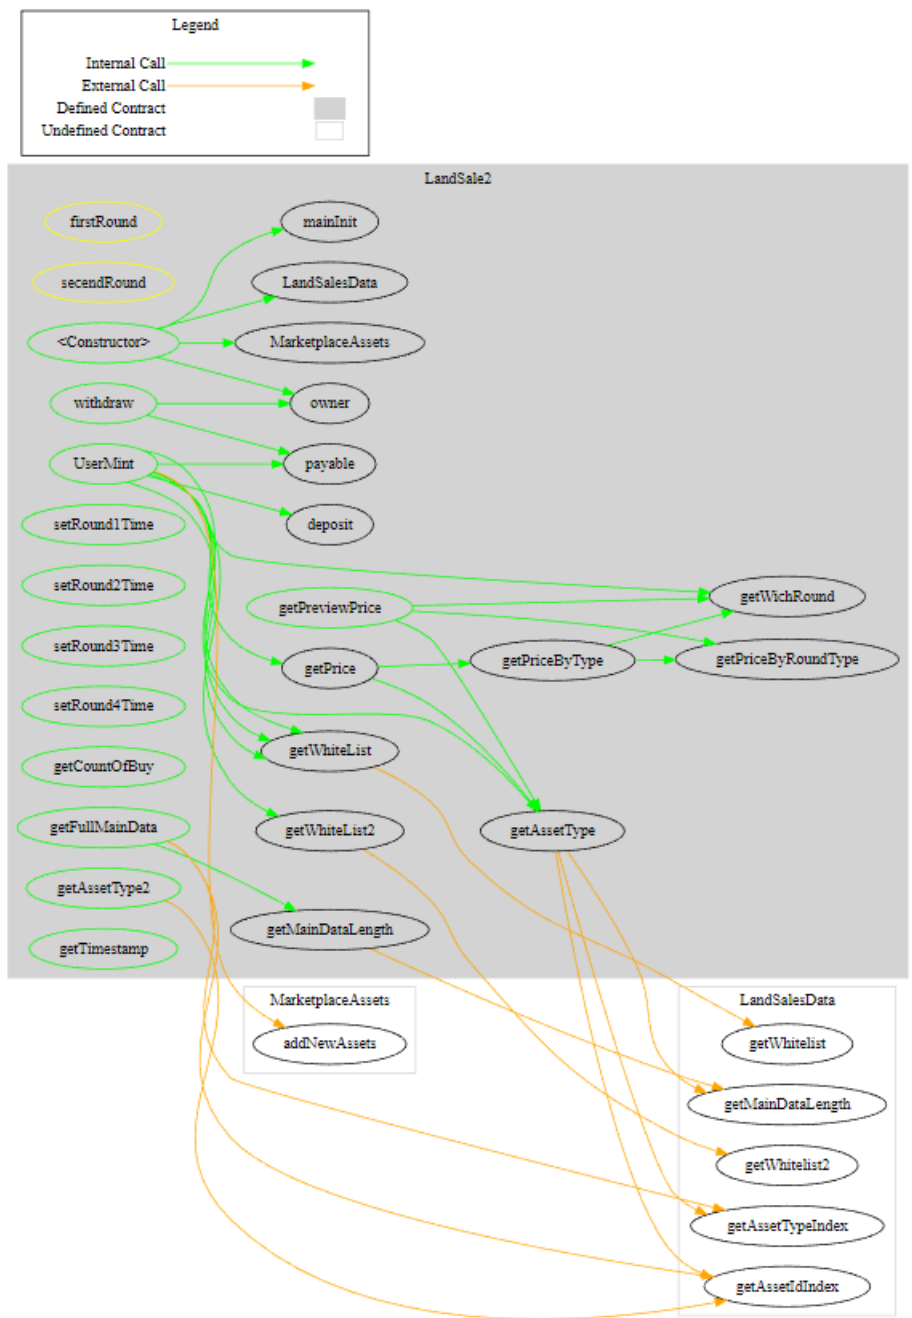

# Inheritance Graph

## Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Is contract an upgradeable
2. Correct implementation of Token standard
3. Deployer cannot mint any new tokens
4. Deployer cannot burn or lock user funds
5. Deployer cannot pause the contract
6. Deployer can set fees
7. Deployer can blacklist/antisnipe address
8. Overall checkup (Smart Contract Security)

## Is contract an upgradeable

Name	
Is contract an upgradeable?	No

## Correct implementation of Token standard

ERC20				
Function	Description	Exist	Tested	Verified
totalSupply	Provides information about the total token supply			
balanceOf	Provides account balance of the owner's account			
transfer	Executes transfers of a specified number of tokens to a specified address			
transferFrom	Executes transfers of a specified number of tokens from a specified address			
approve	Allow a spender to withdraw a set number of tokens from a specified account			
allowance	Returns a set number of tokens from a spender to the owner			

ERC721				
Function	Description	Exist	Tested	Verified
BalanceOf	Count all NFTs assigned to an owner			
OwnerOf	Find the owner of an NFT			
SafeTransferFrom	Transfers the ownership of an NFT from one address to another address			
SafeTransferFrom	See above - Difference is that this function has an extra data parameter			
TransferFrom	Transfer ownership of an NFT			
Approve	Change or reaffirm the approved address for an NFT			
SetApprovalForAll	Enable or disable approval for a third party ("operator") to manage all of `msg.sender`'s assets			
GetApproved	Get the approved address for a single NFT			

IsApprovedForAll	Query if an address is an authorized operator for another address			
SupportsInterface	Query if a contract implements an interface			
Name	Provides information about the name			
Symbol	Provides information about the symbol			
TokenURI	Provides information about the TokenUri			

## Write functions of contracts

v1.0

- ◆ deposit 💰
- ◆ withdraw
- ◆ mainInit
- ◆ UserMint 💰
- ◆ setRound1Time
- ◆ setRound2Time
- ◆ setRound3Time
- ◆ setRound4Time

## Deployer cannot mint any new tokens

Name	Exist	Tested	Status
Deployer cannot mint			
Max / Total Supply	N/A		

## Deployer cannot burn or lock user funds

Name	Exist	Tested	Status
Deployer cannot lock			
Deployer cannot burn			

## Deployer cannot pause the contract

Name	Exist	Tested	Status
Deployer cannot pause			

### Comments:

The owner can pause the market.

## Deployer can set fees

Name	Exist	Tested	Status
Deployer can set fees over 25%			
Deployer can set fees to nearly 100% or more			

## Deployer cannot blacklist/antisnipe addresses

Name	Exist	Tested	Status
Deployer can blacklist/antisnipe addresses			

### Comments:

- The owner can include/exclude wallets from whitelist in the other contract named as 'LandDataAddress'

## Overall checkup (Smart Contract Security)

Tested	Verified

### Legend

Attribute	Symbol
Verified / Checked	
Partly Verified	
Unverified / Not checked	
Not available	

## Modifiers and public functions

v1.0

💠	deposit	💰
💠	withdraw	
Ⓜ	onlyOwner	
💠	mainInit	
💠	UserMint	💰
💠	setRound1Time	
Ⓜ	onlyOwner	
💠	setRound2Time	
Ⓜ	onlyOwner	
💠	setRound3Time	
Ⓜ	onlyOwner	
💠	setRound4Time	
Ⓜ	onlyOwner	

### Comments:

- The owner can set the round times for the minting of assets

# Source Units in Scope

v1.0

File	Logic Contracts	Interfaces	Lines	nLines	nSLOC	Comment Lines	Complex. Score
contracts/LandSale2.sol	1	————	216	216	177	8	206
Totals	1	————	216	216	177	8	206

## Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

# Audit Results

# AUDIT PASSED

## Critical issues

No critical issues

## High issues

No high issues

## Medium issues

No medium issues

## Low issues

Issue	File	Type	Line	Description
#1	Main	Drain contract tokens	57	Owner is able to withdraw tokens from the contract to their own account.
#2	Main	Missing Events	49,57,118,121,124	Emit an event for critical parameter changes.
#3	Main	Floating Pragma	-	The current pragma Solidity directive is " <code>^0.8.12</code> ". Contracts should be deployed with the same compiler version and flags that they have been tested with thoroughly. Locking the pragma helps to ensure that contracts do not accidentally get deployed using other versions.

## Informational issues

Issue	File	Type	Line	Description
#1	Main	NatSpec documentation missing	—	If you started to comment your code, also comment all other functions, variables etc.
#2	Main	Unused state variables	21,36,20,30	Remove the variables that are never used in the contract

## Audit Comments

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <https://docs.soliditylang.org/en/v0.5.10/natspec-format.html>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

31. August, 2022:

- There is still an owner (Owner still has not renounced ownership)
- Read the whole report and modifiers section for more information.

## SWC Attacks

ID	Title	Relationships	Status
<a href="#">SWC-1136</a>	Unencrypted Private Data On-Chain	<a href="#">CWE-767: Access to Critical Private Variable via Public Method</a>	PASSED
