# Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Uniswap, Uniswap, PancakeSwap etc’...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Version	Date	Description
1.0	11. March 2023	<ul style="list-style-type: none"><li>• Layout project</li><li>• Automated- /Manual-Security Testing</li><li>• Summary</li></ul>
1.1	17. May 2023	<ul style="list-style-type: none"><li>• Reaudit</li></ul>

**Note** - This Audit report consists of a security analysis of the **Dione Protocol Governance** smart contracts. This analysis did not include functional testing (or unit testing) of the contract’s logic.

## Description

This document, the Whitepaper, is the only source of truth regarding Dione. The technologies and products introduced in this document are currently in development and this document will continue to evolve. Therefore, this document does not aim to provide definite and absolute answers.

## Project Engagement

During the Date of 10 May 2023, **Dione Protocol Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

# Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

## **Methodology**

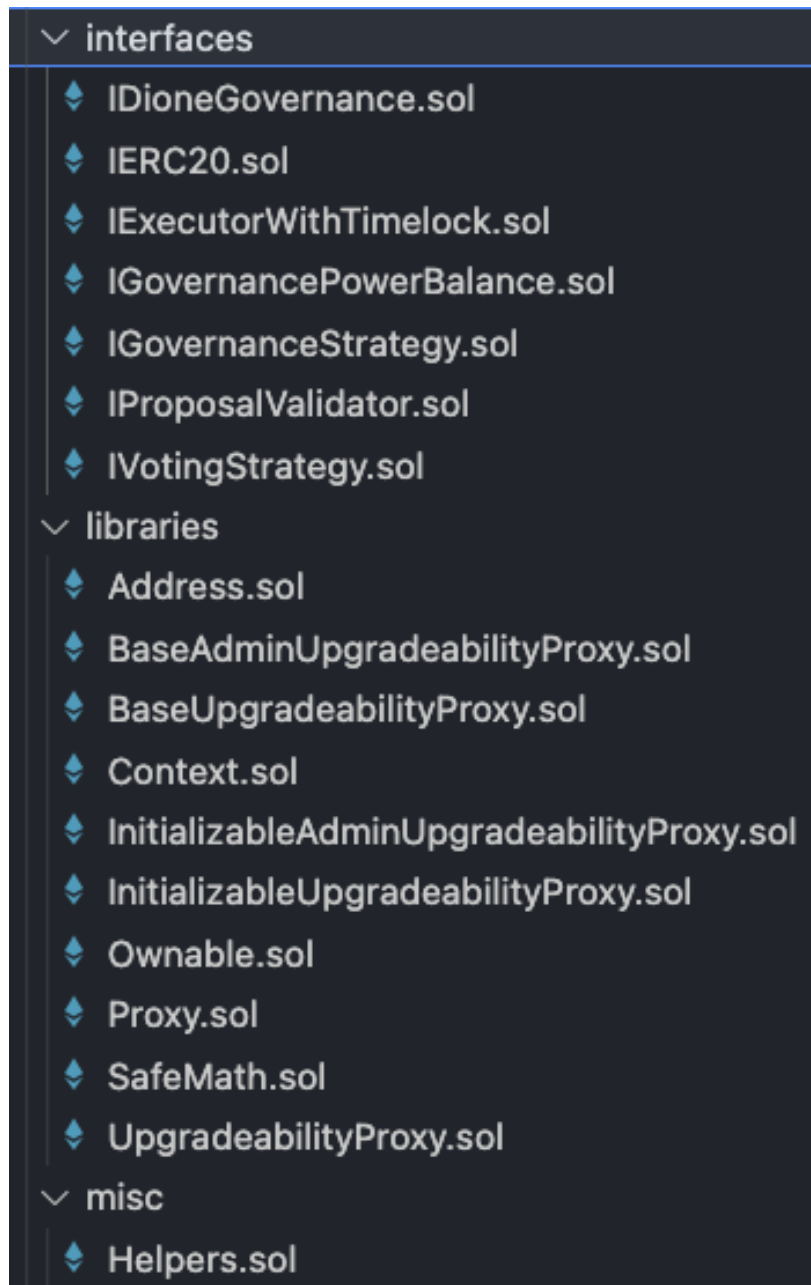

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

**v1.0**

## Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

*A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.*

### v1.0

File Name	SHA-1 Hash
DioneGovernance/contracts/governance/interfaces/IDioneGovernance.sol	b265a68da47e7c3e40f178788a125ccb03be03bc

# Inheritance Graph

## Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Is contract an upgradeable
2. Overall checkup (Smart Contract Security)

## Is contract an upgradeable

Name	
Is contract an upgradeable?	No

.

## Overall checkup (Smart Contract Security)

# Modifiers and public functions v1.1

## DioneGovernance

```
◆ create
◆ cancel
◆ queue
◆ execute 💰
◆ submitVote
◆ submitVoteBySignature
◆ setGovernanceStrategy
Ⓜ onlyOwner
◆ setVotingDelay
Ⓜ onlyOwner
◆ authorizeExecutors
Ⓜ onlyOwner
◆ unauthorizeExecutors
Ⓜ onlyOwner
◆ __abdicate
Ⓜ onlyGuardian
```

## ExecutorWithTimelock

```
◆ setDelay
Ⓜ onlyTimelock
◆ acceptAdmin
Ⓜ onlyPendingAdmin
◆ setPendingAdmin
Ⓜ onlyTimelock
◆ queueTransaction
Ⓜ onlyAdmin
◆ cancelTransaction
Ⓜ onlyAdmin
◆ executeTransaction 💰
Ⓜ onlyAdmin
```

## Ownership/Authority Privileges

### ❖ [DioneGovernance.sol](#)

- Set Governance Strategy
- Set voting delay
- Authorise/Unauthorize Executors
- Only Guardian Address can renounce the guardianship

### ❖ [ExecutorWithTimelock.sol](#)

- OnlyAdmin address can queue and cancel Transactions for a target address
- Only the contract address can Set pending admin address, and then the pending admin address can accept being an admin
- Only Admin address can manually execute the transaction

**Please check if an OnlyOwner or similar restrictive modifier has been forgotten.**

# Source Units in Scope

<b>Totals</b>	<b>8</b>	<b>9</b>	<b>1816</b>	<b>1260</b>	<b>692</b>	<b>634</b>	<b>531</b>

## Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalised lines of the source unit (e.g. normalises functions spanning multiple lines)
nSLOC	normalised source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

# Audit Results

## Critical issues

**No critical issues**

## High issues

**No high issues**

## Medium issues

**No medium issues**

## Low issues

Issue	File	Type	Line	Description	Status
#1	All	Contract doesn't import npm packages from source (like OpenZeppelin etc.)	—	We recommend to import all packages from npm directly without flatten the contract. Functions could be modified or can be susceptible to vulnerabilities	Fixed
#2	All	A floating pragma is set	—	The current pragma Solidity directive is „^0.8.10”.	Fixed
#3	DioneGovernances.sol	Missing zero address validation	216, 224	Check that the address is not zero	Fixed
#4	ExecutorWithTimelock.sol	Missing zero address validation	76	Check that the address is not zero	Fixed

## Informational issues

Issue	File	Type	Line	Description	Status
-------	------	------	------	-------------	--------

#1	All	NatSpec documentation missing	—	If you started to comment your code, also comment all other functions, variables etc.	Fixed
----	-----	-------------------------------	---	---	-------

## Audit Comments

We recommend you to use the special form of comments (NatSpec Format, Follow link for more information <https://docs.soliditylang.org/en/latest/natspec-format.html>) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.

### 17. May 2023:

- There is still an owner (Owner still has not renounced ownership)
- Owner can deploy a new version of the contract which can change any limit and give owner new privileges
- Read whole report and modifiers section for more information
