## Introduction

[SolidProof.io](#) is a brand of the officially registered company MAKE Network GmbH, based in Germany. We're mainly focused on Blockchain Security such as Smart Contract Audits and KYC verification for project teams.

Solidproof.io assess potential security issues in the smart contracts implementations, review for potential inconsistencies between the code base and the whitepaper/documentation, and provide suggestions for improvement.

## Disclaimer

[SolidProof.io](#) reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of the security or functionality of the technology we agree to analyze.

# Project Overview

## Summary

Project Name	Pharaoh Finance
Website	<a href="http://pharaoh.finance/">http://pharaoh.finance/</a>
About the project	A BSC-based community-driven DAO that empowers both creators and users with a tailored protocol and abundant, sustainable liquidity. Delve into the wonders of our domain, where you'll find an unrivaled infrastructure designed to meet your unique needs.
Chain	BSC
Language	Solidity
Codebase Link	<b>Pharaoh:</b> 0x7E9dA054A09343eC5e201212625d3ec7c9df3661 <b>Treasury:</b> 0xc5F6dD1d38651724210bF3b06afe8c89023c09c4 <b>DAI_Bond:</b> 0xCcc3bf6048A76B652f467693309cF25E6B895bfd <b>USDT_Bond:</b> 0x10d3F4F9e88aA0679C25C99727846A486c7a8B70 <b>USDC_Bond:</b> 0x627bc7aCB5b4b80c5cc8c12Da0690E52aE7F44Dc <b>Masterchef:</b> 0xEeC163bB9D899c3FFfb4AE6EaeB89796B680873A
Forked Status	The Contracts are Forked from PancakeSwap and Olympus DAO
Unit Tests	Not Provided

## Audit Summary

Version	Delivery Date	Changelog
v1.0	27. November 2023	<ul style="list-style-type: none"> <li>• Layout Project</li> <li>• Automated- /Manual-Security Testing</li> <li>• Summary</li> </ul>

**Note** - The following audit report presents a comprehensive security analysis of the smart contract utilized in the project that includes outside manipulation of the contract's functions in a malicious way. This analysis did not include functional testing (or unit testing) of the contract/s logic. We cannot guarantee 100% logical correctness of the contract as we did not functionally test it. This includes internal calculations in the formulae used in the contract.

## File Overview

The Team provided us with the files that should be tested in the security assessment. This audit covered the following files listed below with an SHA-1 Hash.

File Name	SHA-1 Hash
contracts/PharTreasury.sol	8e1502a5ccbb8dbad12ba9bc17bf35f421493298
contracts/MasfterChef.sol	e0f74728b89ed8f3c7c77b6bf4e39cbd1e7fd960
contracts/PharBond.sol	900f43b0e716190328cdfd16912d9692ecd69942
contracts/Phar.sol	126ec3dd168e45d3bc3e61f6f5c37c09b7f2bff1

*Please note: Files with a different hash value than in this table have been modified after the security check, either intentionally or unintentionally. A different hash value may (but need not) be an indication of a changed state or potential vulnerability that was not the subject of this scan.*

## Imported packages

*Used code from other Frameworks/Smart Contracts (direct imports).*

Dependency / Import Path	Count
@openzeppelin/contracts/access/Ownable.sol	1
@openzeppelin/contracts/token/ERC20/extensions/IERC20Metadata.sol	1
@openzeppelin/contracts/utils/Address.sol	1
@openzeppelin/contracts/utils/Context.sol	1

**Note for Investors:** We only audited contracts mentioned in the scope above. All contracts related to the project apart from that are not a part of the audit, and we cannot comment on its security and are not responsible for it in any way

## Audit Information

### Vulnerability & Risk Level

Risk represents the probability that a certain source threat will exploit vulnerability and the impact of that event on the organization or system. The risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 - 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 - 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 - 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 - 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

## Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to check the repository for security-related issues, code quality, and compliance with specifications and best practices. To this end, our team of experienced pen-testers and smart contract developers reviewed the code line by line and documented any issues discovered.

We check every file manually. We use automated tools only so that they help us achieve faster and better results.

## Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - a. Reviewing the specifications, sources, and instructions provided to SolidProof to ensure we understand the size, scope, and functionality of the smart contract.
  - b. Manual review of the code, i.e., reading the source code line by line to identify potential vulnerabilities.
  - c. Comparison to the specification, i.e., verifying that the code does what is described in the specifications, sources, and instructions provided to SolidProof.
2. Testing and automated analysis that includes the following:
  - a. Test coverage analysis determines whether test cases cover code and how much code is executed when those test cases are executed.
  - b. Symbolic execution, which is analysing a program to determine what inputs cause each part of a program to execute.
3. Review best practices, i.e., review smart contracts to improve efficiency, effectiveness, clarity, maintainability, security, and control based on best practices, recommendations, and research from industry and academia.
4. Concrete, itemized and actionable recommendations to help you secure your smart contracts.

## Overall Security

### Upgradeability

**Contract is not an upgradeable**

**Deployer cannot update the contract with new functionalities**

Description

The contract is not an upgradeable contract. The deployer is not able to change or add any functionalities to the contract after deploying.

Comment

N/A

## Ownership

**The ownership is not renounced**

**✗ The owner is not renounce**

Description

The owner has not renounced the ownership that means that the owner retains control over the contract's operations, including the ability to execute functions that may impact the contract's users or stakeholders. This can lead to several potential issues, including:

- Centralizations
- The owner has significant control over contract's operations

Comment

N/A

**Note** - If the contract is not deployed then we would consider the ownership to be not renounced. Moreover, if there are no ownership functionalities then the ownership is automatically considered renounced.

**Alleviation** - "We need ownership of bond contract to adjustment the bond price according to the token price change. but there is not risk for this and 100% safe to users. we only can adjustment the bond price there with ownership, and no risk for users there."

## Ownership Privileges

*These functions can be dangerous. Please note that abuse can lead to financial loss. We have a guide where you can learn more about these Functions.*

### Minting tokens

*Minting tokens refer to the process of creating new tokens in a cryptocurrency or blockchain network. This process is typically performed by the project's owner or designated authority, who has the ability to add new tokens to the network's total supply.*

#### Contract owner cannot mint new tokens

 **The owner cannot mint new tokens**

Description	The owner is not able to mint new tokens once the contract is deployed.
-------------	---

Comment	N/A
---------	-----

## Burning tokens

*Burning tokens is the process of permanently destroying a certain number of tokens, reducing the total supply of a cryptocurrency or token. This is usually done to increase the value of the remaining tokens, as the reduced supply can create scarcity and potentially drive up demand.*

### Contract owner cannot burn tokens

 **The owner cannot burn tokens**

Description	The owner is not able burn tokens without any allowances.
Comment	N/A

## Blacklist addresses

*Blacklisting addresses in smart contracts is the process of adding a certain address to a blacklist, effectively preventing them from accessing or participating in certain functionalities or transactions within the contract. This can be useful in preventing fraudulent or malicious activities, such as hacking attempts or money laundering.*

**Contract owner cannot blacklist addresses**

**The owner cannot blacklist addresses**

Description

The owner is not able blacklist addresses to lock funds.

Comment

N/A

## Fees and Tax

*In some smart contracts, the owner or creator of the contract can set fees for certain actions or operations within the contract. These fees can be used to cover the cost of running the contract, such as paying for gas fees or compensating the contract's owner for their time and effort in developing and maintaining the contract.*

**Contract owner cannot set fees more than 25%**

**The owner cannot levy unfair taxes**

Description	The owner is not able to set the fees above 25%
Comment	N/A

## Lock User Funds

*In a smart contract, locking refers to the process of restricting access to certain tokens or assets for a specified period of time. When tokens or assets are locked in a smart contract, they cannot be transferred or used until the lock-up period has expired or certain conditions have been met.*

### Owner cannot lock the contract

**The owner cannot lock the contract**

Description

The owner is not able to lock the contract by any functions or updating any variables.

Comment

N/A

## External/Public functions

External/public functions are functions that can be called from outside of a contract, i.e., they can be accessed by other contracts or external accounts on the blockchain. These functions are specified using the function declaration's external or public visibility modifier.

## State variables

State variables are variables that are stored on the blockchain as part of the contract's state. They are declared at the contract level and can be accessed and modified by any function within the contract. State variables can be defined with a visibility modifier, such as public, private, or internal, which determines the access level of the variable.

## Components

 <b>Contracts</b>	 <b>Libraries</b>	 <b>Interfaces</b>	 <b>Abstract</b>
9	12	16	3

## Exposed Functions

This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.

 <b>Public</b>	 <b>Payable</b>
162	10

External	Internal	Private	Pure	View
91	238	13	34	78

## StateVariables

<b>Total</b>	 <b>Public</b>
115	84

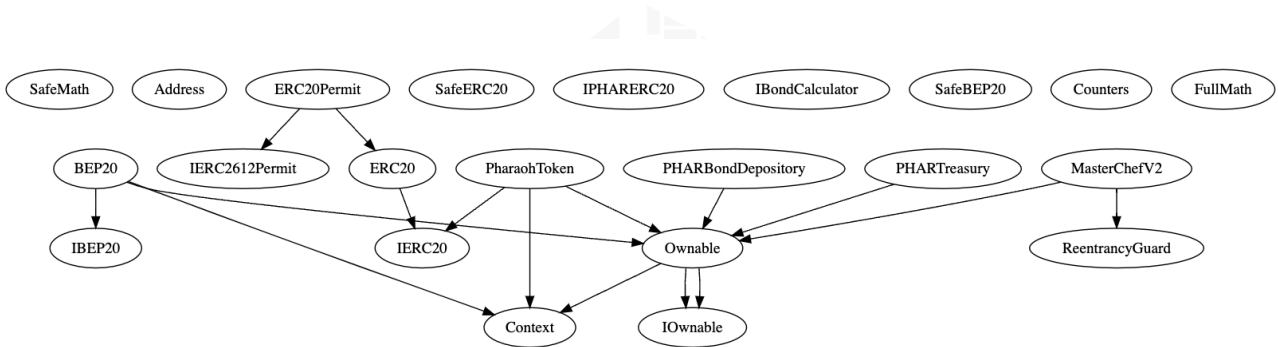

## Capabilities

Solidity Versions observed	Transfers ETH	 Can Receive Funds	 Uses Assembly	ECRecover
0.7.5 0.6.12 ^0.8.20	Yes	Yes	Yes	Yes

## Inheritance Graph

An inheritance graph is a graphical representation of the inheritance hierarchy among contracts. In object-oriented programming, inheritance is a mechanism that allows one class (or contract, in the case of Solidity) to inherit properties and methods from another class. It shows the relationships between different contracts and how they are related to each other through inheritance.

## Centralization Privileges

*Centralization can arise when one or more parties have privileged access or control over the contract's functionality, data, or decision-making. This can occur, for example, if the contract is controlled by a single entity or if certain participants have special permissions or abilities that others do not.*

In the project, there are authorities that have access to the following functions:

File	Privileges
Pharaoh	<ul style="list-style-type: none"> <li>• onlyOwner               <ul style="list-style-type: none"> <li>• Include/Exclude addresses from fees</li> <li>• Add/Remove pair addresses</li> <li>• Manage Fees</li> <li>• Enable Trading of the tokens but cannot disable it</li> </ul> </li> </ul>
MasterChef	<ul style="list-style-type: none"> <li>• onlyOwner               <ul style="list-style-type: none"> <li>• Add new lp to the pool</li> <li>• Set Pool's Allocation point and deposit fee (upto 10%)</li> <li>• Set Fee Address</li> <li>• Update Emission Rate and Bonus Multiplier value</li> </ul> </li> </ul>
PharBond	<ul style="list-style-type: none"> <li>• onlyPolicy               <ul style="list-style-type: none"> <li>• Initialize Bond Terms</li> <li>• Set Parameters for new bonds</li> <li>• Set Staking helper address</li> <li>• Enable/Disable deposits in the contract</li> </ul> </li> </ul>

## Recommendations

To avoid potential hacking risks, it is advisable for the client to manage the private key of the privileged account with care. Additionally, we recommend enhancing the security practices of centralized privileges or roles in the protocol through a decentralized mechanism or smart-contract-based accounts, such as multi-signature wallets.

Here are some suggestions of what the client can do:

- Consider using multi-signature wallets: Multi-signature wallets require multiple parties to sign off on a transaction before it can be executed, providing an extra layer of security e.g. Gnosis Safe

- Use of a timelock at least with a latency of e.g. 48-72 hours for awareness of privileged operations
- Introduce a DAO/Governance/Voting module to increase transparency and user involvement
- Consider Renouncing the ownership so that the owner cannot modify any state variables of the contract anymore. Make sure to set up everything before renouncing.

# Audit Results

## Critical issues

**No critical issues**

## High issues

**No high issues**

## Medium issues

### #1 | Regain Ownership

File	Severity	Location	Status
PharBond	Medium	L37—48	ACK

**Description** - The owner can regain ownership after transferring it with the following steps:

1. Call the pushManagement function to set \_newOwner to the own address
2. Transfer/renounce ownership
3. Call the pullManagement function to get ownership back

**Remediation** - Make sure to set the \_owner to address zero after using the push management function

**Alleviation** - “We need ownership of bond contract to adjustment the bond price according to the token price change. but there is not risk for this and 100% safe to users. we only can adjustment the bond price there with ownership, and no risk for users there.”

## Low issues

### #1 | Missing Events

File	Severity	Location	Status
PharBond	Low	L713, 745, 767, 789	ACK

**Description** - Make sure to emit events for all the critical parameter changes in the contract to ensure the transparency and trackability of all the state variable changes.

### # 2| Old Compiler version

File	Severity	Location	Status
All	Low	N/A	ACK

**Description** - The contracts use outdated compiler versions, which are not recommended for deployment as they may be susceptible to known vulnerabilities.

**Remediation** - Use a newer pragma version. At least use the 0.8.18 version.

## Informational issues

### #1 | NatSpec documentation missing

File	Severity	Location	Status
All	Informational		ACK

**Description** - If you started to comment on your code, comment on all other functions, variables etc.

### #2 | Missing Error Message

File	Severity	Location	Status
PharBond	Informational	L1108, 1109	ACK

**Description** - Ensure that all the 'require' statements revert with an error message

### #3 | Contract doesn't import npm packages from source (like OpenZeppelin etc.)

File	Severity	Location	Status
All	Informational	N/A	ACK

**Description** - We recommend importing all packages from npm directly without flattening the contract. Functions could be modified or can be susceptible to vulnerabilities.

### Legend for the Issue Status

Attribute or Symbol	Meaning
Open	The issue is not fixed by the project team.
Fixed	The issue is fixed by the project team.
Acknowledged(ACK)	The issue has been acknowledged or declared as part of business logic.
