Disclaimer

SolidProof.io reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'…)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Project Engagement

During the 09th of April 2022, **Binemon Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon aspossible.
Medium	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.
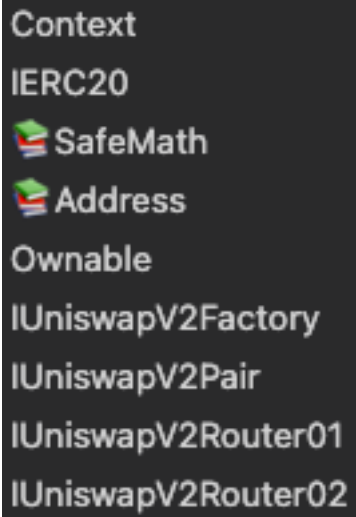

Methodology

The auditing process follows a routine series of steps:
1. Code review that includes the following:
    i)   Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
    ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
    iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.

2. Testing and automated analysis that includes the following:
    i)   Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
    ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.

3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.

4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

```
Context
IERC20
SafeMath
Address
Ownable
IUniswapV2Factory
IUniswapV2Pair
IUniswapV2Router01
IUniswapV2Router02
```

Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.
v1.0

File Name	SHA-1 Hash

Scope of Work/Verify Claims

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:
1. Correct implementation of Token standard
2. Deployer cannot mint any new tokens
3. Deployer cannot burn or lock user funds
4. Deployer cannot pause the contract
5. Overall checkup (Smart Contract Security)

Correct implementation of Token standard

ERC20				
Function	**Description**	**Exist**	**Tested**	**Verified**
TotalSupply	Provides information about the total token supply	✓	✓	✓
BalanceOf	Provides account balance of the owner's account	✓	✓	✓
Transfer	Executes transfers of a specified number of tokens to a specified address	✓	✓	✓
TransferFrom	Executes transfers of a specified number of tokens from a specified address	✓	✓	✓
Approve	Allow a spender to withdraw a set number of tokens from a specified account	✓	✓	✓
Allowance	Returns a set number of tokens from a spender to the owner	✓	✓	✓

Modifiers and public functions
v1.0

- transfer
- approve
- transferFrom
- increaseAllowance
- decreaseAllowance
- deliver
- excludeFromReward
  - onlyOwner
- includeInReward
  - onlyOwner
- callRiskFreeValue
  - onlyOwner
- excludeFromFee
  - onlyOwner
- includeInFee
  - onlyOwner
- setTaxFeePercent
  - onlyOwner
- setLiquidityFeePercent
  - onlyOwner
- setMaxTxAmount
  - onlyOwner
- setTreasuryDivisor
  - onlyOwner
- setNumTokensSellToAddToLiquidity
  - onlyOwner
- setBuybackUpperLimit
  - onlyOwner
- setTreasuryAddress
  - onlyOwner
- setSwapAndLiquifyEnabled
  - onlyOwner
- setBuyBackEnabled
  - onlyOwner

- renounceOwnership
  - onlyOwner
- transferOwnership
 - onlyOwner
- timelock
  - onlyOwner
- untimelock

Comments

- Deployer can set following state variables without any limitations
    - buyBackUpperLimit
    - minimumBeforeSwapToTreasury

- Deployer can enable/disable following state variables
    - buyBackEnabled
    - swapAndLiquifyEnabled
    - _isExcludedFromFee
    - _isExcluded
    - _excluded

- Deployer can set following addresses
    - _owner
    - treasuryAddress

- Owner can buy back tokens with callRiskFreeValue function
- Deliver function cannot be called by excluded addresses

Please check if an OnlyOwner or similar restrictive modifier has been forgotten.

Source Units in Scope
v1.0

Type	File	Logic Contracts	Interfaces	Lines	nLines	nSLOC	Comment Lines	Complex. Score	Capabilities
📝📚🔍🍥	contracts/binemon.sol	5	5	946	710	533	40	583	🖥️💰🔺☀️
📝📚🔍🍥	Totals	5	5	946	710	533	40	583	🖥️💰🔺☀️

Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

Audit Results

AUDIT PASSED

Critical issues

No critical issues

High issues

No high issues

Medium issues

Issue	File	Type	Line	Description
#1	Main	Regain ownership	See description	Owner can regain ownership after transferring it with following steps: 1. Call lock function to set _previousOwner to the own address 2. Call unlock function to get ownership back 3. Transfer/renounce ownership 4. Call unlock function to get ownership back Make sure to set the _previousOwnership back to address zero after using the unlock function

Low issues

Issue	File	Type	Line	Description

#1	Main	Contract doesn't import npm packages from source (like OpenZeppelin etc.)	-	We recommend to import all packages from npm directly without flatten the contract. Functions could be modified or can be susceptible to vulnerabilities
#2	Main	A floating pragma is set	14	The current pragma Solidity directive is „"^0.8.4"".
#3	Main	Missing Zero Address Validation (missing-zero-check)	926	Check that the address is not zero
#4	Main	State variable visibility is not set	462	It is best practice to set the visibility of state variables explicitly
#5	Main	Local variables shadowing	625, 534	Rename the local variables that shadow another component
#6	Main	Missing Events Arithmetic	923, 905, 910, 919, 900, 915	Emit an event for critical parameter changes

Informational issues

Issue	File	Type	Line	Description
#1	Main	State variables that could be declared constant (constable-states)	444, 442, 443, 438	Add the `constant` attributes to state variables that never change
#2	Main	Misspelling	See description	Change following words: - tokensIntoLiqudity L473 - recieve L944 - swaping L944 Make sure to change it everywhere else as well.

Commented Code exist

There are some instances of code being commented out in the following files that should be removed:

File	Line	Comment

Main	81	// assert(a == b * c + a % b); // There is no case in which this doesn't hold
Main	654	/*&& balance > uint256(1 * 10**18)*/

Recommendation
Remove the commented code, or address them properly.

Audit Comments
We recommend you to use the special form of comments (NatSpec Format, Follow link for more information https://docs.soliditylang.org/en/v0.5.10/natspec-format.html) for your contracts to provide rich documentation for functions, return variables and more. This helps investors to make clear what that variables, functions etc. do.
